

# Earth and Space

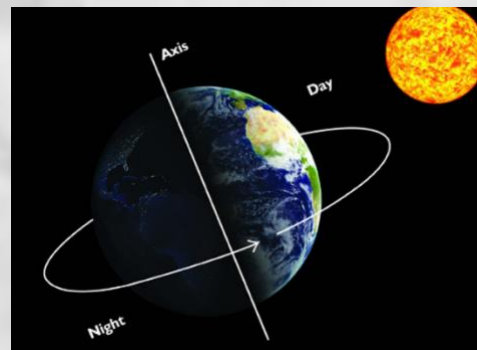

My Very Easy Method Just Speeds Up Naming Planets

The phases of the moon

Day and night

| Tier 3 Vocab |                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Solar system | the collection of eight planets and their moons in orbit round the sun                                                               |
| Sun          | The Sun is a star which is located at the center of our solar system                                                                 |
| Mercury      | Mercury is the smallest planet in the Solar System and the closest to the Sun.                                                       |
| Venus        | Venus is the second planet from the Sun. It is named after the Roman goddess of love and beauty                                      |
| Earth        | Earth is the third planet from the Sun and the only astronomical object known to harbour and support life                            |
| Mars         | Mars is the fourth planet from the Sun and the second-smallest planet in the Solar System, being larger than only Mercury            |
| Jupiter      | Jupiter is a gas giant and doesn't have a solid surface, but it may have a solid inner core about the size of Earth                  |
| Saturn       | Saturn is the sixth planet from the Sun and the second-largest in the Solar System, after Jupiter.                                   |
| Uranus       | Uranus is the seventh planet from the Sun. Its name is a reference to the Greek god of the sky,                                      |
| Neptune      | Neptune is the eighth and farthest-known Solar planet from the Sun. In the Solar System, it is the fourth-largest planet by diameter |
| Pluto        | Pluto is a dwarf planet in the Kuiper belt, a ring of bodies beyond the orbit of Neptune.                                            |
| rotate       | Move or cause to move in a circle round an axis or centre.                                                                           |
| Orbit        | The curved path of a celestial object or spacecraft round a star, planet, or moon, especially a periodic elliptical revolution.      |
| Axis         | An imaginary line about which a body rotates                                                                                         |
